

ECE 220

Lecture x0019 - 04/03

Linked data structures & C to LC3

Reminders

- **Exam on 04/10**, study study!
 - Study material has been posted
 - Lectures 7 through 15 inclusive (including **enums**)
 - HKN review on Sunday
- About the exam
 - Paper-format (same as last time)
 - Four questions
 - Arrays & recursion (in C)
 - CtoLC3, concept questions

Structs in LC3

Memory allocation

```
struct flightType {  
    char ID[7];           // Max 6 characters  
    int altitude;         // in meters  
    int longitude;        // in tenths of degrees  
    int latitude;         // in tenths of degrees  
    int heading;          // in tenths of degrees  
    double airSpeed;      // in kilometers/hour  
};  
  
int x;  
struct flightType plane;  
int y;
```

Memory representation

```
typedef struct Node{  
    char symbol;  
    struct Node *next;  
}node;
```

```
int main(){  
    node N3, N2, N1;  
    N1.symbol = 'E'  
    N2.symbol = 'C'  
    N3.symbol = 'E'  
  
    N1.next = &N2;  
    N2.next = &N3;  
    N3.next = NULL;  
}
```

	Address	Value	Symbol
N1	x6000	E	N1.symbol
	x6001	x6002	N1.next
N2	x6002	C	N2.symbol
	x6003	x6004	N2.next
N3	x6004	E	N3.symbol
	x6005	NULL	N3.next

Printing a linked list

What is at memory location x4004?

```
typedef struct Node{
    char symbol;
    struct Node *next;
}node;

void print_list(node *cursor){
    if (cursor==NULL)
        /* List empty; do nothing */
        return;
    else{
        /* Print and recurse */
        printf("%c", cursor->symbol);
        print_list(cursor->next);
    }
}
```

```
.ORIG x3000
```

```
MAIN
```

```
LD R5, RSTACK
LD R6, RSTACK
LD R0, HEAD
STR R0, R6, #0 ; push argument onto stack
ADD R6, R6, #-1
JSR PRINT_LIST
ADD R6, R6, #2 ; caller teardown (pop retval & args)
HALT
```

```
HEAD .FILL x4004
RSTACK .FILL x7000
```

```
typedef struct Node{
    char symbol;
    struct Node *next;
}node;

void print_list(node *cursor){
    if (cursor==NULL)
        /* List empty; do nothing */
        return;
    else{
        /* Print and recurse */
        printf("%c", cursor->symbol);
        print_list(cursor->next);
    }
}
```

Printing a linked list

Linked Lists Practice

More linked lists

- Exercise(s)
 - Given two already sorted linked lists, merge them.
 - Reverse a singly linked list.
 - Implement a doubly linked list.

Sorted merging

- Given two lists of commanders-in-chiefs, merge the list while maintaining their sorted property
 - (Reagan, 1911)→(Nixon, 1913)→(Trump, 1946)→(Bush, 1946)→NULL
 - (Carter, 1924)→(Biden, 1942)→(Clinton, 1946)→(Obama, 1961)→NULL
- What should the merged list look like?

```
typedef struct person{
    char *name;
    unsigned int byear;
    struct person *next;
}node;
```

Reverse a singly-linked list

- Given the list, generate a **new** (not just print) linked list where the nodes are linked in **reverse** order.
 - (Reagan, 1911)→(Nixon, 1913)→(Carter, 1924)→(Biden, 1942)→(Trump, 1946)→(Bush, 1946)→(Clinton, 1946)→(Obama, 1961)→NULL
 - (Obama, 1961)→(Clinton, 1946)→(Bush, 1946)→(Trump, 1946)→(Biden, 1942)→(Carter, 1924)→(Nixon, 1913)→(Reagan, 1911)→NULL

Doubly linked lists

- How many pointers to maintain?
 - Head pointer? Tail pointer?

- How should insertion/deletion work?

Left as exercise!

- At head, middle, tail.
- We will just do an autosorted one.

```
typedef struct person{
    char *name;
    struct person *next;
    struct person *prev;
}node;
```

More practice? Okey doke!

- Practicing on linked lists:
 - Stanford's [Linked List Question Bank](#)
 - Also good practice for technical interviews!
